

8-HYDROXY-1-OXO-TETRAHYDROPYRROLOPYRAZINE COMPOUNDS USEFUL AS  
HIV INTEGRASE INHIBITORS

5 This application claims the benefit of U.S. Provisional Application No. 60/409,745, filed September 11, 2002, the disclosure of which is hereby incorporated by reference in its entirety.

FIELD OF THE INVENTION

10 The present invention is directed to 8-hydroxy-1-oxo-tetrahydropyrrolopyrazine compounds and pharmaceutically acceptable salts thereof, their synthesis, and their use as inhibitors of the HIV integrase enzyme. The compounds of the present invention and their pharmaceutically acceptable salts are useful for preventing or treating infection by HIV and for treating, delaying the onset of, or preventing AIDS.

15 BACKGROUND OF THE INVENTION

A retrovirus designated human immunodeficiency virus (HIV) is the etiological agent of the complex disease that includes progressive destruction of the immune system (acquired immune deficiency syndrome; AIDS) and degeneration of the central and peripheral nervous system. This virus was previously known as LAV, HTLV-III, or ARV. A common feature of retrovirus replication is the insertion by virally-encoded integrase of proviral DNA into the host cell genome, a required step in HIV replication in human T-lymphoid and monocytoid cells. Integration is believed to be mediated by integrase in three steps: assembly of a stable nucleoprotein complex with viral DNA sequences; cleavage of two nucleotides from the 3' termini of the linear proviral DNA; covalent joining of the recessed 3' OH termini of the proviral DNA at a staggered cut made at the host target site. The fourth step in the process, repair synthesis of the resultant gap, may be accomplished by cellular enzymes.

25 Nucleotide sequencing of HIV shows the presence of a pol gene in one open reading frame [Ratner et al., *Nature* 1985, 313: 277]. Amino acid sequence homology provides evidence that the pol sequence encodes reverse transcriptase, integrase and an HIV protease [Toh et al., *EMBO J.* 1985, 4: 1267; Power et al., *Science* 1986, 231: 1567; Pearl et al., *Nature* 1987, 329: 351]. All three enzymes have been shown to be essential for the replication of HIV.

It is known that some antiviral compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS and similar diseases, including reverse transcriptase inhibitors such as azidothymidine (AZT) and efavirenz and protease inhibitors such as indinavir and nelfinavir. The compounds of this invention are inhibitors of HIV integrase and inhibitors of HIV replication. The inhibition of integrase in vitro and of HIV replication in cells is a direct result of inhibiting the strand transfer reaction catalyzed by the recombinant integrase in vitro in HIV infected cells. A particular advantage of the present invention is highly specific inhibition of HIV integrase and HIV replication.

As used herein, the term "C<sub>1-6</sub> alkyl" (or "C<sub>1</sub>-C<sub>6</sub> alkyl") means a linear or branched chain alkyl group having from 1 to 6 carbon atoms and includes all of the hexyl alkyl and pentyl alkyl isomers as well as n-, iso-, sec- and t-butyl, n- and isopropyl, ethyl and methyl. "C<sub>1-4</sub> alkyl" means n-, iso-, sec- and t-butyl, n- and isopropyl, ethyl and methyl.

The term "C<sub>0</sub>" as employed in expressions such as "C<sub>0-6</sub> alkyl-" means a direct covalent bond. For example, in the group -C<sub>1-6</sub> alkyl-N(R<sub>a</sub>)-C<sub>0-6</sub> alkyl-S(O)<sub>n</sub>R<sub>k</sub>, when the second alkylene group is "C<sub>0</sub>", then the group is -C<sub>1-6</sub> alkyl-N(R<sub>a</sub>)-S(O)<sub>n</sub>R<sub>k</sub>.

The term "-C<sub>1-6</sub> alkyl-" refers to a C<sub>1</sub> to C<sub>6</sub> linear or branched alkyl group as just defined which is bivalent. It can alternatively be referred to as "C<sub>1-6</sub> alkylene" or "C<sub>1-6</sub> alkanediyl". A class of alkenes of particular interest with respect to the invention is -(CH<sub>2</sub>)<sub>1-6</sub>-, and sub-classes of particular interest include -(CH<sub>2</sub>)<sub>1-4</sub>-, -(CH<sub>2</sub>)<sub>1-3</sub>-, -(CH<sub>2</sub>)<sub>1-2</sub>-, and -CH<sub>2</sub>-.

The term "C<sub>2-6</sub> alkenyl" (or "C<sub>2</sub>-C<sub>6</sub> alkenyl") means a linear or branched chain alkenyl group having from 2 to 6 carbon atoms and includes all of the hexenyl and pentenyl isomers as well as 1-butenyl, 2-butenyl, 3-butenyl, isobutenyl, 1-propenyl, 2-propenyl, and ethenyl (or vinyl). A class of alkynyls of particular interest with respect to the invention is  $\text{—C}\equiv\text{C—}(\text{CH}_2)_{1-4}\text{H}$  (e.g.,  $\text{—C}\equiv\text{C—CH}_3$ ). Another class of alkynyls of particular interest with respect to the invention is alkynyls selected from  $\text{—CH}_2\text{—}\equiv\text{—}(\text{CH}_2)_{1-3}\text{H}$  and  $\text{—}(\text{CH}_2)_2\text{—}\equiv\text{—}(\text{CH}_2)_{1-2}\text{H}$ .

The term "C<sub>3-8</sub> cycloalkyl" (or "C<sub>3</sub>-C<sub>8</sub> cycloalkyl") means a cyclic ring of an alkane having three to eight total carbon atoms (i.e., cyclopropyl, cyclobutyl, cyclopentyl,

cyclohexyl, cycloheptyl, or cyclooctyl). Similar terms such as "C3-6 cycloalkyl" have an analogous meaning.

The term "halogen" (or "halo") refers to fluorine, chlorine, bromine and iodine (alternatively referred to as fluoro, chloro, bromo, and iodo).

The term "C1-6 haloalkyl" (which may alternatively be referred to as "C1-C6 haloalkyl" or "halogenated C1-C6 alkyl") means a C1 to C6 linear or branched alkyl group as defined above with one or more halogen substituents. The term "C1-4 haloalkyl" has an analogous meaning. The term "C1-6 fluoroalkyl" has an analogous meaning except that the halogen substituents are restricted to fluoro. A class of fluoroalkyls of particular interest with respect to the invention is the series (CH<sub>2</sub>)<sub>0-4</sub>CF<sub>3</sub> (i.e., trifluoromethyl, 2,2,2-trifluoroethyl, 3,3,3-trifluoro-n-propyl, etc.).

The term "oxo" means a divalent oxygen substituent; i.e., =O. An oxo substituent on a carbon atom in a heteroaromatic ring refers to the keto form of the keto-enol tautomer, as exemplified here for an oxypyridinyl substituent:

Compounds of the present invention having an oxo substituent on a carbon atom of a heteroaromatic ring are understood to include compounds in which only the keto form is present, compounds in which only the enol form is present, and compounds in which the keto and enol forms are both present.

The term "aryl" as used herein refers to an aromatic carbocyclic ring or an aromatic carbocyclic fused ring system. The fused ring system contains two or more carbocyclic rings in which each ring shares two adjacent carbon atoms with at least one other ring. The aryl group may be attached to the rest of the molecule at any carbon atom which results in a stable compound. A subset of aryl groups particularly suitable for use in the present invention (e.g., in the definition of R<sup>k</sup>) includes those selected from phenyl, naphthyl, anthryl, and phenanthryl. Another particularly suitable subset of aryl groups is phenyl and naphthyl. Still another particularly suitable subset of aryl groups is phenyl per se.

The term "heterocyclic ring" refers to a 4- to 8-membered, saturated or unsaturated monocyclic ring that contains one or more heteroatoms (e.g., from 1 to 6

heteroatoms, from 1 to 5 heteroatoms, from 1 to 4 heteroatoms, from 1 to 3 heteroatoms, 1 or 2 heteroatoms, or 1 heteroatom) independently selected from N, O and S and a balance of carbon atoms (the ring typically contains at least one carbon atom); and wherein any one or more of the nitrogen and sulfur heteroatoms is optionally oxidized, and any one or more of the nitrogen heteroatoms is optionally quaternized. The heterocyclic ring may be attached to the rest of the molecule via any heteroatom or carbon atom in the ring, provided that attachment results in the creation of a stable structure. When the heterocyclic ring has substituents, it is understood that the substituents may be attached to any atom in the ring, whether a heteroatom or a carbon atom, provided that a stable chemical structure results.

A subset of the heterocyclic rings useful in the present invention (e.g., in the definition of R<sup>k</sup>) includes any 4- to 7-membered saturated or mono-unsaturated heterocyclic ring, wherein the ring contains at least one carbon atom and from 1 to 4 heteroatoms independently selected from N, O and S. A subgroup of this subset includes any 4- to 7-membered saturated or mono-unsaturated heterocyclic ring in which the ring contains at least one carbon atom and a total of from 1 to 4 heteroatoms independently selected from 1 to 4 N atoms, from 0 to 2 O atoms, and from 0 to 2 S atoms. Representative examples of saturated heterocyclic rings include piperidinyl, morpholinyl, thiomorpholinyl, thiazolidinyl, isothiazolidinyl, oxazolidinyl, isooxazolidinyl, pyrrolidinyl, imidazolidinyl, piperazinyl, tetrahydrofuranyl, tetrahydrothienyl, pyrazolidinyl, hexahydropyrimidinyl, thiazinanyl (e.g., 1,2-thiazinanyl )<sub>S-N</sub>), thiazepanyl, thiadiazepanyl, dithiazepanyl, azepanyl (i.e., )<sub>N</sub>), diazepanyl, thiadiazinanyl (e.g., 1,2,6-thiadiazinanyl )<sub>S-N-N</sub>), and dioxanyl. Representative examples of mono-unsaturated rings are the same as the saturated rings listed in the preceding sentence except that each ring contains a double bond.

Another subset of the heterocyclic rings useful in the present invention (e.g., in the definition of HetB) includes any 5- or 6-membered saturated or mono-unsaturated ring containing from 1 to 4 heteroatoms independently selected from N, O and S. A useful subgroup of this subset includes any 5- or 6-membered saturated or mono-unsaturated heterocyclic ring in which the ring contains at least one carbon atom and a total of from 1 to 4 heteroatoms independently selected from 1 to 4 N atoms, from 0 to 2 O atoms, and from 0 to 2 S atoms. Another useful subgroup is identical to the preceding subgroup, except that it is limited to saturated heterocyclic rings. Still another subgroup of this subset of heterocyclic rings suitable

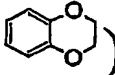

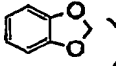

for use in the present invention includes any 5- or 6-membered saturated ring containing 1 or 2 N atoms and carbon atoms. Representative examples of this subgroup include piperidinyl, pyrazolidinyl, imidazolidinyl, piperazinyl, piperidiny, and hexahydropyrimidinyl.

5 Still another subset of the heterocyclic rings useful in the present invention are the heteroaromatic rings. The term "heteroaromatic ring" (alternatively "heteroaryl ring") generally refers to a heterocyclic ring as defined above in which the ring is an aromatic ring. A useful subgroup of this subset (e.g., in the definition of R<sup>k</sup>, HetA, or HetC) includes any 5- or 6-membered monocyclic aromatic ring which consist of carbon atoms and from 1 to 4 heteroatoms independently selected from N, O and S. Representative examples of this subgroup include  
10 pyridyl, pyrrolyl, pyrazinyl, pyrimidinyl, pyridazinyl, triazinyl, thienyl (or thiophenyl), thiazolyl, furanyl, imidazolyl, pyrazolyl, triazolyl, tetrazolyl, oxazolyl, isooxazolyl, oxadiazolyl, oxatriazolyl, thiazolyl, isothiazolyl, and thiadiazolyl. Another useful subgroup of this subset includes any 5- or 6-membered heteroaromatic ring in which the ring contains a total of from 1 to 4 heteroatoms independently selected from 1 to 4 N atoms, from 0 to 2 O atoms, and from 0 to 2  
15 S atoms. Another useful subgroup includes any 5- or 6-membered heteroaromatic ring containing 1 or 2 N atoms and carbon atoms.

The term "fused bicyclic heterocycle" refers to any 8- to 12-membered bicyclic ring system containing one or more heteroatoms (e.g., from 1 to 6 heteroatoms, from 1 to 5 heteroatoms, from 1 to 4 heteroatoms, from 1 to 3 heteroatoms, 1 or 2 heteroatoms, or 1  
20 heteroatom) independently selected from N, O and S, in which one ring contains all of the heteroatoms or each ring contains at least one of the heteroatoms, and wherein each ring is saturated or unsaturated, and two adjacent ring atoms are shared by each of the rings in the ring system and each of the two shared atoms is independently a carbon atom or a heteroatom. Any one or more of the nitrogen and sulfur heteroatoms in the ring system is optionally oxidized, and  
25 any one or more of the nitrogen heteroatoms is optionally quaternized. The fused bicyclic heterocycle may be attached to the rest of the molecule via any heteroatom or carbon atom in the ring, provided that attachment results in the creation of a stable structure. When the bicyclic heterocycle has substituents, it is understood that the substituents may be attached to any atom in the ring, whether a heteroatom or a carbon atom, provided that a stable chemical structure results.

30 A subset of the fused bicyclic heterocycles useful in the present invention (e.g., in the definition of R<sup>1</sup>) includes any 9- or 10-membered fused bicyclic heterocycle containing from 1 to 4 heteroatoms independently selected from N, O and S, wherein at least one of the rings is aromatic. Representative examples of bicyclic heterocycles in this subset include benzotriazolyl, indolyl, isoindolyl, indazolyl, indoliny, isoindoliny, quinoxaliny, quinazoliny, cinnoliny,

chromanyl, isochromanyl, tetrahydroquinolinyl, quinolinyl, tetrahydroisoquinolinyl, isoquinolinyl, 2,3-dihydrobenzofuranyl, 2,3-dihydrobenzo-1,4-dioxinyl (i.e., ) and benzo-1,3-dioxolyl (i.e., ).

5 Unless expressly stated to the contrary, an "unsaturated" ring is a partially or fully unsaturated ring.

Unless expressly stated to the contrary, all ranges cited herein are inclusive. For example, a heterocyclic ring described as containing from "1 to 4 heteroatoms" means the ring can contain 1, 2, 3 or 4 heteroatoms.

10 When any variable (e.g., R<sup>a</sup>, R<sup>b</sup>, or R<sup>c</sup>) occurs more than one time in any constituent or in Formula (I) or in any other formula depicting and describing compounds of the invention, its definition on each occurrence is independent of its definition at every other occurrence. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

15 The term "substituted" (e.g., as in "each aryl is optionally substituted with from 1 to 5 substituents ...") includes mono- and poly-substitution by a named substituent to the extent such single and multiple substitution (including multiple substitution at the same site) is chemically allowed.

The symbol " ~~~ " in front of an open bond in the structural formula of a group marks the point of attachment of the group to the rest of the molecule.

20 The compounds of the present invention may have asymmetric centers and may occur, except when specifically noted, as mixtures of stereoisomers or as individual diastereomers, or enantiomers, with all isomeric forms being included in the present invention.

As would be recognized by one of ordinary skill in the art, all of the compounds of the present invention can exist as tautomers such as the following:

It is to be understood for the purposes of the present invention that a reference herein to a compound of Formula (I) is a reference to compound I per se, or to any one of its tautomers per se (e.g., IA or IB), or to mixtures of two or more of the tautomers (e.g., two or more of I, IA, and IB).

The compounds of the present invention are useful in the inhibition of HIV integrase, the prevention or treatment of infection by human immunodeficiency virus (HIV) and the prevention, treatment or the delay in the onset of consequent pathological conditions such as AIDS. Preventing AIDS, treating AIDS, delaying the onset of AIDS, or preventing or treating infection by HIV is defined as including, but not limited to, treatment of a wide range of states of HIV infection: AIDS, ARC (AIDS related complex), both symptomatic and asymptomatic, and actual or potential exposure to HIV. For example, the compounds of this invention are useful in treating infection by HIV after suspected past exposure to HIV by such means as blood transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery.

The compounds of this invention are useful in the preparation and execution of screening assays for antiviral compounds. For example, the compounds of this invention are useful for isolating enzyme mutants, which are excellent screening tools for more powerful antiviral compounds. Furthermore, the compounds of this invention are useful in establishing or determining the binding site of other antivirals to HIV integrase, e.g., by competitive inhibition. Thus the compounds of this invention are commercial products to be sold for these purposes.

The compounds of the present invention can be administered in the form of pharmaceutically acceptable salts. The term "pharmaceutically acceptable salt" refers to a salt which possesses the effectiveness of the parent compound and which is not biologically or otherwise undesirable (e.g., is neither toxic nor otherwise deleterious to the recipient thereof).

5 Suitable salts include acid addition salts which may, for example, be formed by mixing a solution of the compound of the present invention with a solution of a pharmaceutically acceptable acid such as hydrochloric acid, sulfuric acid, acetic acid, trifluoroacetic acid, or benzoic acid. When the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof can include alkali metal salts (e.g., sodium or potassium salts), alkaline earth metal salts  
10 (e.g., calcium or magnesium salts), and salts formed with suitable organic ligands such as quaternary ammonium salts. Also, in the case of an acid (-COOH) or alcohol group being present, pharmaceutically acceptable esters can be employed to modify the solubility or hydrolysis characteristics of the compound.

For the purpose of preventing or treating HIV infection or preventing, treating or  
15 delaying the onset of AIDS, the compounds of the present invention can be administered orally, parenterally (including subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques), by inhalation spray, or rectally, in the form of a unit dosage of a pharmaceutical composition containing a therapeutically effective amount of the compound and conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles.

20 The term "administration" and variants thereof (e.g., "administering" a compound) in reference to a compound of the invention mean providing the compound to the individual in need of treatment. When a compound of the invention is provided in combination with one or more other active agents (e.g., antiviral agents useful for treating HIV infection or AIDS), "administration" and its variants are each understood to include concurrent and sequential  
25 provision of the compound and other agents.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combining the specified ingredients in the specified amounts.

By "pharmaceutically acceptable" is meant that the ingredients of the  
30 pharmaceutical composition must be compatible with each other and not deleterious to the recipient thereof.

The term "subject" (which may be alternatively referred to herein as "patient") as used herein refers to an animal, preferably a mammal, most preferably a human, who has been the object of treatment, observation or experiment.

The term "therapeutically effective amount" as used herein means that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue, system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease being treated. When the active compound (i.e., active ingredient) is administered as the salt, references to the amount of active ingredient are to the free acid or free base form of the compound.

The pharmaceutical compositions can be in the form of orally-administrable suspensions or tablets or capsules, nasal sprays, sterile injectible preparations, for example, as sterile injectible aqueous or oleagenous suspensions or suppositories. These compositions can be prepared by methods and contain excipients which are well known in the art. Suitable methods and ingredients are described in Remington's Pharmaceutical Sciences, 18<sup>th</sup> edition, edited by A. R. Gennaro, Mack Publishing Co., 1990, which is herein incorporated by reference in its entirety.

The compounds of this invention can be administered orally in a dosage range of 0.001 to 1000 mg/kg of mammal (e.g., human) body weight per day in a single dose or in divided doses. One preferred dosage range is 0.01 to 500 mg/kg body weight per day orally in a single dose or in divided doses. Another preferred dosage range is 0.1 to 100 mg/kg body weight per day orally in single or divided doses. For oral administration, the compositions can be provided in the form of tablets or capsules containing 1.0 to 500 milligrams of the active ingredient, particularly 1, 5, 10, 15, 20, 25, 50, 75, 100, 150, 200, 250, 300, 400, and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

As noted above, the present invention is also directed to use of the HIV integrase inhibitor compounds of the present invention with one or more agents useful in the treatment of HIV infection or AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of one or more of the HIV/AIDS antivirals, immunomodulators, antiinfectives, or vaccines useful for treating HIV infection or AIDS. The compounds of the present invention can be readily prepared according to the following reaction schemes and examples, or modifications thereof, using readily available starting materials, reagents and conventional synthesis procedures. In these reactions, it is also possible to make use of variants which are themselves known to those of ordinary skill in this art, but are not mentioned in greater detail. Furthermore, other methods for preparing compounds of the invention will be readily apparent to the person of ordinary skill in the art in light of the following reaction schemes and examples. Unless otherwise indicated, all variables are as defined above.

A general method for the preparation of compounds of the present invention embraced by Formula (I) is shown in Scheme 1, wherein piperazin-2-one **1-3** is treated with dialkylalkoxymethylenemalonate **1-4** and then with a deprotonating agent (e.g., Li or Na bis(trimethylsilyl)amide or Na hydride) at low temperature (e.g., from about 0 to about 25°C) in

an anhydrous non-protic solvent (e.g., DMF or THF) to give alkyl 8-hydroxy-1-oxo-1,2,3,4-tetrahydropyrrolopyrazine-7-carboxylate **1-6**. The carboxylate **1-6** can be hydrolyzed to give the 7-carboxylic acid **1-7**. Carboxylate **1-6** can also be treated with amine to give the 7-carboxamide **1-8**.

5           The piperazin-2-one **1-3** reactant can be obtained by alkylation of amine-protected piperazin-2-one **1-1** followed by deprotection to afford **1-3**, as depicted in Scheme 1. Compound **1-1** can be prepared using methods described in Choi et al., *J. Med. Chem.* 1999, 3647; Najman-Bronzewska et al., *Pharmazie* 1997, 198; Fryer et al., *J. Org. Chem.* 1991, 3715, Dinsmore et al., *Organic Prep. & Procedures International*. 2002, 369, or routine variations thereof. An  
10 alternative method for preparing piperazin-2-one **1-3** is described in Bernotas et al., *Tetrahedron Lett.* 1996, 7339; Saari et al., *J. Med. Chem.* 1990, 2590; Sugihara et al., *J. Med. Chem.* 1998, 489, Dinsmore et al., *Organic Prep. & Procedures International*. 2002, 369, or routine variations thereof.

15           Some of the suitable dialkylalkoxymethylenemalonates **1-4** are commercially available (e.g., diethylethoxymethylenemalonate or dimethylmethoxy-methylenemalonate). Others can be obtained by preparative methods known in the art; e.g., heterocyclylalkyloxymethylene malonates can be prepared by the method described in Boger et al., *J. Org. Chem* 1988, 3408, or routine variations thereof.

20           The protection and deprotection of the amine in the piperazin-2-one can be accomplished using conventional amine protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973 and in T.W. Greene & P.G.M. Wuts, Protective Groups in Organic Synthesis, John Wiley & Sons, 1991.

SCHEME 1

5

Scheme 2 exemplifies the same approach as set forth in Scheme 1 for the preparation of compounds embraced by Formula (II). In Scheme 2, 4-((aryl- or alkyl-oxy)carbonyl)piperazin-2-one 2-1 is alkylated with benzyl bromide 2-2 in the presence of a base (e.g., LiHMDS, NaHMDS, or NaH) to afford 1-benzyl-4-((aryl- or alkyl-oxy)carbonyl)piperazin-2-one 2-3, which can be deprotected by standard methods (e.g., treatment with hydrogen) to afford 1-benzylpiperazin-2-one 2-4. Benzylpiperazinone 2-4 can then be reacted with

10

dialkylethoxymethylenemalonate **2-5** in a suitable solvent (e.g., a hydrocarbon such as toluene) at elevated temperature (e.g., from about 60 to about 90°C) to afford the 2,2-dialkylloxycarbonyl-ethenyl-substituted product **2-6**. Compound **2-6** can then be treated with a deprotonating agent (e.g., LiHMDS) in an aprotic solvent (e.g., DMF) to provide the alkyl 2-benzyl-8-hydroxy-1-oxo-1,2,3,4-tetrahydropyrrolopyrazine-7-carboxylate **2-7**. Carboxylate **2-7** can be converted to the corresponding acid **2-8** by hydrolysis (e.g., with NaOH) and to the corresponding amide by treatment with an amine in the presence of a Lewis base (e.g., AlCl<sub>3</sub>).

SCHEME 2

10

Scheme 3 illustrates a method for preparing compounds of Formula (IV).

# 5 SCHEME 3

Scheme 4 is a variation of Scheme 3 and exemplifies the preparation of compounds of Formula (IV) with  $\text{R}^Z = \text{H}$ . In Scheme 4, the piperazin-2-one 4-2 can be obtained by treatment of amine-protected piperazin-2-one 4-1 with base (e.g., LiHMDS, NaHMDS, or NaH) in DMF, followed by addition of methoxymethyl chloride or similar amide protecting group. Selective deprotection of the amine protecting group by hydrogenolysis provides piperazin-2-one 4-3. Treatment of piperazin-2-one 4-3 with dialkylalkoxymethylenemalonate 1-4 and then with a deprotonating agent provides 8-hydroxy-1-oxo-1,2,3,4-tetrahydropyrrolopyrazine-7-carboxylate 4-5. The carboxylate 4-5 can be hydrolyzed to give the 7-carboxylic acid 4-6, and deprotected to provide 4-7. Carboxylate 4-5 can also be treated with amine to give the 7-carboxamide 4-8, and deprotected to provide 4-9.

SCHEME 4

In the processes for preparing compounds of the present invention set forth in the foregoing schemes, functional groups in various moieties and substituents may be sensitive or reactive under the reaction conditions employed and/or in the presence of the reagents employed. Such sensitivity/reactivity can interfere with the progress of the desired reaction to reduce the yield of the desired product, or possibly even preclude its formation. Accordingly, it may be necessary or desirable to protect sensitive or reactive groups on any of the molecules concerned. Protection can be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973 and in T.W. Greene & P.G.M. Wuts, Protective Groups in Organic Synthesis, John Wiley & Sons, 1991. The

protective groups may be removed at a convenient subsequent stage using methods known in the art. The use of protective groups is illustrated in Scheme 4.

The following examples serve only to illustrate the invention and its practice. The examples are not to be construed as limitations on the scope or spirit of the invention.

To a cold (0 °C) solution of *tert*-butyl 3-oxopiperazine-1-carboxylate (2.0 g, 9.9 mmol) in DMF (100 mL) under an atmosphere of nitrogen, a solution of lithium bis(trimethylsilyl)amide in THF (10.9 mL, 10.9 mmol) was added and stirred at the temperature for 30 min. The resultant solution was treated with 4-chlorobenzyl bromide (2.1, 10.5 mmol), and stirred at room temperature overnight. The product mixture was concentrated under vacuum, and the residue partitioned between aqueous HCl and ethyl acetate. The organic extracted was washed with brine, dried over anhydrous magnesium sulfate, filtered, and concentrated under vacuum.
